

VERONICA HENDRICKS, Film Director and Producer

"Folie a Deux and other tales of Morgellons and nano"

Veronica's Story:

I've been researching Morgellons since spring of 2008, when I witnessed the most frightening thing I've ever seen, a nano wire moving in and out of my friend's chest.

During my effort to find answers, I was treated as delusional, even though I myself do not claim to be afflicted.

The only credible person I've found with an explanation is ignored by "main stream medicine", to the point of appearing black listed.

While a deliberate effort is being made by government agencies to keep the general public ignorant, the problem appears to be escalating to epidemic proportions and people are suffering horribly, with very little help or support.

I'm just one person, with almost no resources, doing the only thing I can. I am attempting to release my first film, (that I actually call a film experiment), to the public in an effort to promote interest and create a dialogue.

The title is "Folie a Deux and other tales of Morgellons and nano". I began with Folie a Deux, because that is a French term meaning delusions shared by two. For me, that is one of the most frightening things about this issue. People who go to their medical practitioners for help are not believed, even though there is ample physical evidence, and even more frightening, people who try to get help for sufferers are not believed as well.

We understand now that brand new sciences have integrated into our lives, mostly without our knowledge. Sciences that even the most educated among us are not familiar with. How many general practitioners know the properties of advanced nano materials, nano devices and nano machines? Yet we know these things have been integrated into medicine and herbicides for years now. The same can be said about gene splicing. Very few general practitioners are aware of the advances in nucleic acid engineering, yet each year we hear of more and more plants and animals who are genetically engineered being introduced into our food chain. It has actually been happening for decades.

So with all these new environmental, health and medical variables why are medical practitioners so reluctant to entertain the possibility that something new, that they have not yet had to deal with, can be happening to their patients? I don't know if I'll ever understand that.

Along this journey for answers I've met some wonderful people who, despite their suffering, have comforted and inspired me. I feel it is my moral obligation to speak the truth about what I've experienced and advocate for these individuals.

"Folie a Deux and other tales of Morgellons and nano" is one small effort to raise awareness to a problem that one day may afflict us all.
